

Neurological Foundation

Who are we?

The Neurological Foundation is a New Zealand charity working to protect one of the most important parts of who we are – our brains.

With the help of our generous supporters, we fund life-changing research and education into neurological conditions. These are conditions that affect the brain, spine and nervous systems, and they can change how a person thinks, moves, feels and lives their day-to-day life.

Why does this matter?

Neurological conditions are far more common than many people realise. In fact, 1 in 3 New Zealanders will be directly affected by a neurological disorder at some point in their lifetime. There are more than 700 different neurological conditions, and they can affect people of every age – from babies and children through to older adults.

Because of this, ongoing investment in neurological research and education is not just important – it's essential for the health and wellbeing of our future.

What we do

Our vision is simple but powerful: to invest in world-class neurological research and education that improves quality of life for New Zealanders living with neurological conditions. These include Alzheimer's disease, dementia, Parkinson's disease, motor neuron disease, stroke, multiple sclerosis, epilepsy, migraine, traumatic brain injury and many more.

Our impact

We are proud to be the leading non-government funder of neurological research in New Zealand. Since 1971, we have invested more than \$90 million into research that helps drive better understanding, earlier diagnosis, improved treatments and – one day – cures.

None of this would be possible without the generosity of our supporters, whose belief in science and hope for breakthroughs continues to change lives.
